1. Overview

The **One Interface - Migration Utility** is designed to streamline the process of transforming multiple XML files into a preferred format and saving them to a desired location. The utility also features a sample context menu styling that conforms to the application theme, which is applied across all context menus within the application.

2. User Flow

Parsing XML Files to Preferred Format

1. **Perform Migration:** Click on the Perform Migration button.
2. **Toolkit Tab:** The Toolkit tab will open by default.
3. **Choose Folder:** Click Choose Folder to select the folder containing the XML files. A file explorer dialog box will appear.
4. **Select Folder:** Choose the folder to display the list of XML files contained within it. The list will automatically populate after selecting the folder.
5. **Transform XML Files:** Click on the Transform XML Files button to initiate the transformation process. You will be able to see the number of successful and unsuccessful transformations. The list view will also indicate whether each file was parsed successfully or not.
6. **Save Files:** Click on the Save button to save the transformed files to the desired location.

Considerations While Saving:

- By default, the save location (target directory) is set to be adjacent to the source directory.
- Users can select a different location by choosing from the file explorer that opens automatically.
- The default target folder name is "Original Name - Parsed".

3. Notes

- Ensure that you have the appropriate permissions to access and modify the files and folders used with the Migration Utility.
- For any issues or additional support, refer to the application's help resources or contact customer support.
